

### **ABSTRACT OF THE DISCLOSURE**

In an ammonia sensor (1), lead portions (7) and (9) are provided on an insulating substrate (5); a pair of comb-shaped electrodes (11) and (13) are connected to the lead portions (7) and (9), respectively; a sensitive layer (15) is provided on the comb-shaped electrodes (11) and (13); and a protective layer (17) is provided on the sensitive layer (15). Particularly, the sensitive layer (15) is formed of a gas-sensitive raw material predominantly containing  $\text{ZrO}_2$  and containing at least W in an amount of 2 to 40 wt.% as reduced to  $\text{WO}_3$ .
